

Progress Review

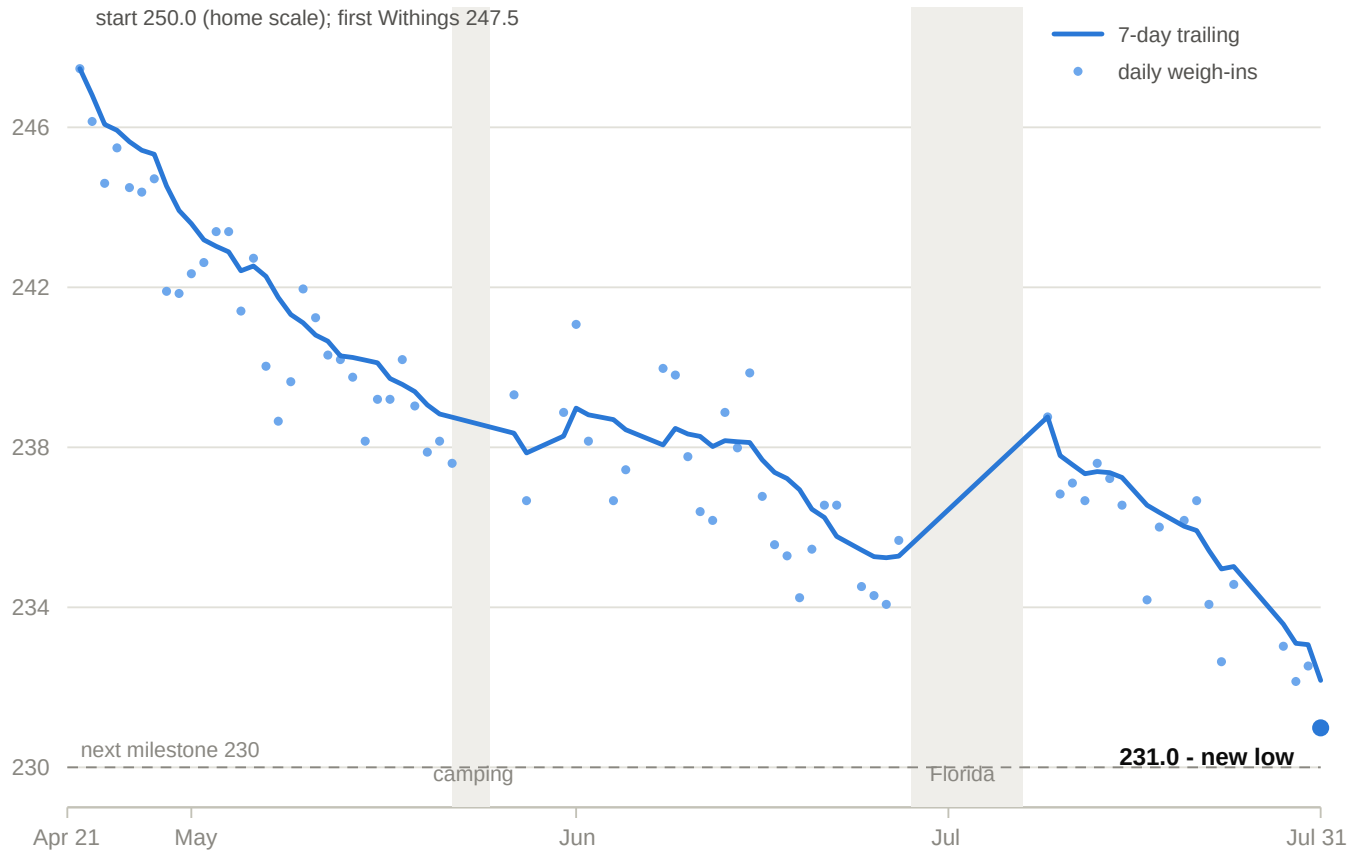

Justin Morgenthau • Day 102 • July 31, 2026

250 lb -> 220 lb goal
Program start: April 21, 2026

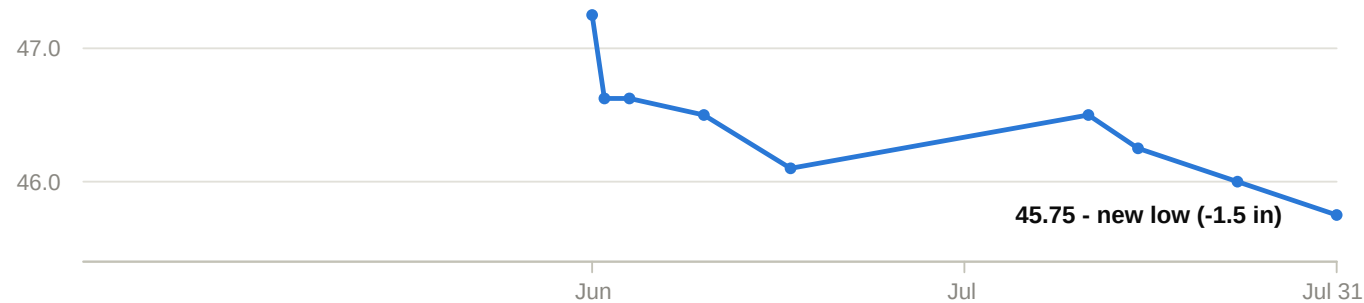

250.0 lb START (home scale)	231.0 lb TODAY - NEW LOW	-19.0 lb LOST (7.6% of body)	11 lb TO GOAL (63% done)
232.2 lb 7-DAY TRAILING	45.75 in WAIST (-1.5 in)	~1.3 lb/wk PACE	2.4% 10-YR CARDIAC RISK

Green = new program low, set the morning of this review

Weight - daily weigh-ins & 7-day trailing average (lb)

Waist - navel landmark, AM fasted (in) - calibrated protocol from Jun 1

Sources: Withings morning on-protocol reads (one documented invalid read 7/8 excluded); waist.csv; daily journals.

Key accomplishments

- **Sustainable -19 lb in 102 days**

No calorie counting, no white-knuckling - through two trips, a graduation, and 'Justin Month' (anniversary, two birthdays, Father's Day), which closed at program lows.

- **The alcohol lever (Jun 16, self-initiated)**

Social-only, in-person, ≤ 3 per occasion, within the eating window. Broke the June plateau within a week; now the default, not an effort.

- **Vacation resilience proven**

Florida week: +7 lb of scale water, waist barely moved, fully cleared in 8 days with zero trend cost. Camping proved the same at small scale in May.

- **Strength up while cutting**

KB goblet squat 20 lb $\rightarrow$ 35 lb x 3x10; band resistance bumped twice; Zone 2 base extended to 45-min sessions. PsA joints quiet throughout.

- **Food noise ~gone**

Primer + template + IF produced a GLP-1-like quieting. Capped by the fried-seafood-shack win (Jul 12): a nostalgia trigger beaten solo with pre-load + play-the-tape-forward.

- **The household runs it with him**

Meal plan + recipe rotation grew (gyros, grain bowls, fish tacos); D1 now cooks; labs stable; 10-yr cardiac risk 2.4%.

How the plan evolved

Apr (wk 1-2)

Three experiments: protein primer, one planned snack, 11:15 bedtime. Weekly template built (Justin = template eater). Protein target 150-180 g/day.

Apr-May

Comfort-food protocol; biweekly reviews; hydration anchors; AM sunlight walk; new mattress; waist tracking; recipe rotation to 5+.

May 31

KB progression flipped to load-driven (35 lb). Waist protocol overhauled (navel landmark + calibration sprint). Weight methodology unified (morning-only, 7-day calendar trailing).

Jun 16 - acceleration

Alcohol policy (the keystone). Cadence ~ 3 x/day with rotating health probes (checkin_variety.py). Exercise swaps. Outlive-aligned mechanism talk ~ 2 x/wk.

Jun-Jul

Grill era (weeknight grilling, lean proteins). Vacation protocols. Stretch reordered before elliptical. Hydration re-anchored to meeting transitions.

Open threads

Wheat $\rightarrow$ joint hypothesis (3 hits / 1 miss; celiac serology first, then structured elimination). Early-riser schedule design. Oct 5 lifestyle-medicine consult (ApoB question; LDL ~ 125 looks genetic).

Next up - August

- 230 milestone: ~ 1 lb away, likely within days.
- 220 by $\sim$ mid-October at current pace, then a deliberate maintenance hold + Phase-2 decision.
- Early-riser schedule: phase in through August, full effect when school starts Aug 26 (5:30 wake).
- NH camping trip Aug 10-18 (boondocking; camp meal plan + band workouts outdoors).
- Oct 5 lifestyle-medicine consult - food journal compiled from daily logs.
